SIRT method uses an average correction for all rays applied to each tomography cell [3], but was not employed here. 4. Acoustic emission tomography With the basic principles described in the previous two chapters it is now very easy to depict the concept of acoustic emission tomography using AE events as tomographic sources (Fig. 2).

Description: Those of us who were fortunate enough to attend the symposium on Future Directions in Nuclear Medicine Physics and Engineering at the University of Chicago in 1999 were treated to an extraordinary series of talks on single photon emission computed tomography (SPECT) and positron emission tomography (PET) given by leading experts in the field. This book was inspired by that symposium and is edited and authored by its participants.

Emission tomography (ET) 1 is a branch of medical imaging that encompasses two main techniquesâ€”positron emission tomography (PET) and single-photon emission computed tomography (SPECT) 2 â€”which use radioactive materials to image properties of the body's physiology. For example, ET images can represent the spatial distribution of properties such as glucose metabolism, blood flow, and receptor concentrations.
