Food microbiology is the study of the microorganisms that inhabit, create, or contaminate food, including the study of microorganisms causing food spoilage. " Good" bacteria, however, such as probiotics, are becoming increasingly important in food science. In addition, microorganisms are essential for the production of foods such as cheese, yogurt, bread, beer, wine and, other fermented foods.

Canning is a method of preserving food in which the food contents are processed and sealed in an airtight container. Canning provides a shelf life typically ranging from one to five years, although under specific circumstances it can be much longer. A freeze-dried canned product, such as canned dried lentils, could last as long as 30 years in an edible state.

Interest in the use of plant extracts that possess widespread biological functions has increased in recent years. Myricetin (3,5,7,3,4,5-hexahydroxyflavone cannabiscetin) is a natural flavonol from fruits, vegetables, tea, berries, red wine and medical plants. The dietary intake of myricetin from our foods is about 0.98–1.1 mg per day, which is quite higher than some other flavonols.

Nanowire arrays of SnS/SnS<sub>2</sub> heterojunctions are grown on transparent indium tin oxide (ITO) coated-glass and Si/SiO<sub>2</sub> substrates via chemical vapor transport (CVT). The nanowire arrays are comprised of individual SnS/SnS<sub>2</sub> heterostructures that are highly oriented with their lengths and morphologies controlled by the CVT conditions (i.e. reaction temperature, flow rate, and reaction time).
