Projective geometry is a topic in mathematics. It is the study of geometric properties that are invariant with respect to projective transformations. This means that, compared to elementary geometry, projective geometry has a different setting, projective space, and a selective set of basic geometric concepts. The basic intuitions are that projective space has more points than Euclidean space ...

The above definition of projective space gives a set. For purposes of differential geometry, which deals with manifolds, it is useful to endow this set with a (real or complex) manifold structure. Namely, identifying a point of the projective space with its homogeneous coordinates, let us consider the following subsets of the projective space: $\{ [x:y:z], x \neq 0 \}$, $\{ [x:y:z], y \neq 0 \}$, $\{ [x:y:z], z \neq 0 \}$.
